WHAT IS CLAIMED IS:

- A valve system for a burn-in oven having a burn-in-board including a plurality of integrated circuits being tested under heated conditions, a tray positioned above the burn-in-board to form a heat exchange chamber overlying the burn-in-board, and a first plenum chamber formed above the tray for receiving cooling air, the improvement comprising an individual opening in the tray overlying each of the integrated circuits on the burn-in-board, and individually controlled valve controlling through each individual opening from the first plenum chamber above the tray to the heat exchange chamber, the valve controlled opening forming a path for air flow from the first plenum chamber to the heat exchange chamber.
- 2. The valve system of claim 1, wherein said valve comprises a valve having a through opening and a valving element for controlling flow through the through opening.
- 3. The valve system of claim 2, wherein said valve comprises a body rotatable about a longitudinal axis, and having a body opening transverse to the longitudinal axis, a housing for receiving the body, the housing having at least a part cylindrical surface sealing against a part cylindrical surface of

the body, and the through opening being in the housing and aligning with the body opening in a selected rotational position, and the body controlling reducing the through opening size upon rotation of the body to control flow of air through the valve.

- 4. The valve system of claim 2, wherein there is a separate electric motor connected to each valving element, and a controller to control a position of the valving element.
- 5. The valve system of claim controller for each of the integrated circuits including a temperature of the integrated circuit to provide a temperature signal, the controller controlling the position of the valving element as a function of the temperature signal relative to a reference temperature signal.
- 6. An air flow control plenum assembly for controlling air flow onto heated devices under test, a valve tray overlying the devices under test, a wall supported above the valve tray and having side walls along sides of the valve tray to form a plenum chamber enclosed except for an inlet, a plurality of outlet openings through the valve tray, a separate controllable valve for each outlet opening controlling a flow of air from a source of cooling

الإردال

air provided at the inlet of the plenum chamber to an opposite side of the valve tray, whereby a flow of cooling air is selectively provided through each outlet opening by controlling the position of a a valve element in associated controllable valve.

- 7. The air flow control plenum of claim 6, including a controller for controlling the position of each valve element in response to a selected parameter.
- 8. The air flow control plenum of claim 6, wherein the controller adjusts valve element position as a function of a temperature signal indicating the temperature of the device under test.
- 9. The air flow control plenum of claim 6, wherein the valve element in each valve is a rotary valve element, and a separate motor driving the respective rotary valve element to control the position of the rotary valve element to adjust flow through the respective outlet.
- 10. The air flow control plenum of claim 6, wherein said source of cooling air comprises a second cool air supply chamber at the one end of an oven supporting the air flow control plenum.

اءِ ڙو 'ي

- 11. The air flow control plenum of claim 6, used in combination with a series of vertically stacked air flow control plenums of claim 6 in an oven chamber, each valve tray carrying an associated plenum chamber overlying a burn-in-board having devices under test.
- 12. combination, a burn-in oven, In plurality of first and second trays in the oven, combined with a cooling air flow source, the burn-in oven defining a compartment, a plurality of first forming burn-in-boards having devices test mounted thereon in a preselected array; plurality of second trays comprising valve spaced from each of the burn-in-board trays on a side of each burn-in-board tray so that the valve trays overlie the devices under test and form a laterally extending space between such trays; a cooling air plenum on a side of each valve tray enclosed by a wall and spaced from the respective valve tray, each valve tray having openings overlying each underlying device under test on an associated burn-in-board; and a separate valve controlling flow through each valve tray opening from the cooling air plenum.
- 13. The combination of claim 12, wherein said devices under test comprise holders supporting an integrated circuit under test, a heat sink on the holder, said heat sink extending into the space

C'es ;"

between each burn-in-board tray and its associated overlying valve tray.

- 14. The combination of claim 12, wherein said burn-in oven has a blower for providing a flow of cooling air to the cooling air plenums, and a flow passageway carrying air from said blower to an inlet end of each cooling air plenum to provide cooling air to each of the cooling air plenums.
- 15. The combination claim 12 further including an air exhaust opening at an end of each space between a valve tray and an underlying burn-in-board tray, the exhaust opening being on an opposite side of the burn-in oven from the inlet ends of the cooling air plenums.
- 16. The combination of claim 12, wherein the wall forming the cooling air plenum is connected to the respective valve tray and moves with the valve tray.
- 17. The combination of claim 16, wherein each of the walls is connected to the respective valve tray by side walls extending between the respective wall and valve tray to form a valve tray assembly.

- 18. The combination of claim 17, wherein the side walls are spaced at a portion of a valve tray assembly to form an air inlet.
- 19. A flow control valve for use in a burn-inoven to control air flow through an opening in a
 wall, which opening is aligned with a heated device
 under test, comprising a valve body having an inlet
 and an outlet aligned with the opening in the wall,
 and a rotary valve element movable to open and close
 the outlet.
